

REPUBLIKA HRVATSKA
DRŽAVNI ZAVOD ZA STATISTIKU

PRESS RELEASE

on the development of the application for creating and browsing short-term statistics indicators

As part of the Eurostat project “Technical assistance in business statistics – index of producer prices of services and final energy consumption in agriculture”, the Croatian Bureau of Statistics has developed a web application called the Short-Term Statistics Database. The aforementioned application is a modern and interactive tool used to manage and disseminate short-term statistics data, which provides users with a broader access to data, and enables them to browse and search all short-term statistics indicators at a single point.

Users will have access to more than 20 indicators in the area of industry, construction, retail trade and service activities, and they will be able to browse and search consolidated short-term statistics data by the type of data (e.g. in the area of industry), period, activity, seasonal adjustment and temporal dimension (e.g. base year). All data can be browsed in the form of tables and graphs. The Short-Term Statistics Database also offers the possibility of downloading data in several formats (.xlsx, .csv) at all levels and with the elements available in the search (total, according to MIGs 2009. and to NKD 2007. sections and divisions).

The Croatian Bureau of Statistics, as the main producer of official statistics, continuously monitors and implements international and European statistical standards; a part of these efforts is also the development of the Short-Term Statistics Database – application for creating and browsing.
